

89. A storage wrap material comprising:

- (a) a sheet of non-porous material having a first side and a second side, said sheet of material having a gauge in the range of 0.0001 inches to about 0.002 inches, said first side comprising an active side exhibiting an adhesion peel force after activation by a user which is greater than an adhesion peel force exhibited prior to activation by a user and which is sufficient to form a seal to a target surface, wherein a compressive force of at least 0.1 psi is required to activate said active side, said sheet of material being sufficiently flexible to conform readily to any desired surface and having sufficiently small resiliency that it does not exert undue restorative forces which would tend to cause the seal to fail.

90. A storage wrap material according to Claim 89 wherein the sheet has sufficiently small resiliency that it does not exert undue restorative forces which would tend to cause the seal to fail such that preservation of perishable items is no longer ensured.

91. A storage wrap material comprising: a sheet of non-porous material having a first side and a second side, said first side comprising an active side exhibiting an adhesion peel force after activation by a user which is greater than an adhesion peel force exhibited prior to activation by a user and which is sufficient to form a seal against a target surface, said first side being activatable by hand, said sheet of material being sufficiently flexible to conform readily to any desired surface and having sufficiently small resiliency that it does not exert undue restorative forces which would tend to cause the seal to fail.

92. A storage wrap material according to Claim 91 wherein the sheet has sufficiently small resiliency that it does not exert undue restorative forces which would tend to cause the seal to fail such that preservation of perishable items is no longer ensured.

93. A storage wrap material comprising:

- a sheet of non-porous material having a first side and a second side, said first side comprising an active side exhibiting an adhesion peel force after activation by a user which is greater than an adhesion peel force exhibited prior to activation by a user and which is sufficient to form a seal against a target surface, said sheet of material being sufficiently flexible to conform readily to any desired surface and having sufficiently small resiliency that it does not exert undue restorative forces which would tend to cause

the seal to fail, said active side being adapted to exhibit a bond upon activation selected from one or more of the group consisting of: a refastenable bond, a resealable bond and a releasable bond.

94. A storage wrap material according to Claim 93 wherein the sheet has sufficiently small resiliency that it does not exert undue resorative forces which would tend to cause the seal to fail such that preservation of perishable items is no longer ensured.

Basis for new Claims 87-94 is found, for example, in the original claims and at page 7, lins 1-4 and page 8, lines 18-25.

Respectfully submitted,

FOR: PETER W. HAMILTON ET AL.
